If you wish to fit Bayesian models in R, RStan provides an interface to the Stan programming language. The rstanarm package provides an lm() like interface to many common statistical models implemented in Stan, letting you fit a Bayesian model without having to code it from scratch. If you are interested in machine learning approaches, the keras package provides an R interface to the Keras library. Key Points. The lm() function fits a linear model. summary() gives details of the fitted model

Use fit.st() to fit a Student t distribution to the data in dx and assign the results to tfit. Assign the par.ests component of the fitted model to tpars and the elements of tpars to nu, mu, and sigma, respectively. Fill in hist() to plot a histogram of dx. Fill in dt() to compute the fitted t density at the values dx and assign to yvals. Refer to the video for this equation.

Fitting all available distributions to data ¶ To fit all of the distributions available in reliability, is a similar process to fitting a specific distribution. The user needs to specify the failures and any right censored data. The Beta distribution will only be fitted if you specify data that is in the range 0 to 1.

In “Fitting Distributions with R” Vito Ricci writes; “Fitting distributions consists in finding a mathematical function which represents in a good way a statistical variable. A statistician often is facing with this problem: he has some observations of a quantitative character $x_1, x_2, \dots, x_n$ and he wishes to test if those observations, being a sample of an unknown population, belong from a population with a pdf (probability density function) $f(x, \theta)$, where θ is a vector of ...
