Functions of membrane microdomains on the endocytic pathway: integration of endocytosis and signalling. We are interested in the assembly and dynamics of membrane microdomains that are specialised for signalling on the endocytic pathway. Clathrin coated pits are microdomains responsible for the uptake of a wide variety of cargo.

A coarse-grained computational model is used to investigate the effect of a fluctuating fluid membrane on the dynamics of patchy-particle assembly into virus capsid-like cores. Results from simulations for a broad range of parameters are presented, showing the effect of varying interaction

strength, membrane stiffness, and membrane viscosity.
