Auditory Scene Analysis The Perceptual Organization Of ...

The auditory “scene analysis” problem. Humans and other animals routinely detect, identify, and track sounds coming from a particular source (e.g., someone’s voice, a conspecific call) amid sounds emanating from other sources (e.g., other voices, heterospecific calls, ambient music, or street traffic) (Figure 1). The apparent ease with which they determine which components and attributes in a sound mixture arise from the same source belies the complexity of the underlying biological ...

Temporal coherence and attention in auditory scene analysis

Auditory scene analysis (ASA) refers to the process (es) of parsing the complex acoustic input into auditory perceptual objects representing either physical sources or temporal sound patterns, such as melodies, which contributed to the sound waves reaching the ears. A number of new

Auditory Scene Analysis: The Perceptual Organization Of Sound

The fact that speech need not sound unspeechlike before it can be made to form streams suggests that auditory scene analysis applies as much to

speech as to other types of sounds. Technical details: The syntheses use the formant frequencies measured by Peterson and Barney (1952). Natural-sounding amplitude envelopes were applied to all the signals (a 20-msec rise, an 80-msec decline, and finally an exponential decay with a time constant of 10 msec).

Al Bregman's Website - McGill University

Since the recognition of events depends upon the proper assignment of auditory properties to different sound sources, auditory streaming is fundamental to the process of scene analysis — which in turn is fundamental to music perception.

Auditory scene analysis, streaming, and predictive regularity According to Bregman's (1990) theory, auditory scene analysis occurs in two stages: (1) the formation of alternative organizational schemes for incoming acoustic information, and (2) the selection of one of the alternative organizational schemes to be perceived.

The laboratory, under the direction of Albert S. (Al) Bregman, studied the perceptual organization of sound, from 1969 to 2006, using computers to generate the acoustic patterns that we studied. As the research progressed, we came to realize that the interesting examples of auditory organization that we were studying were actually part of a much more general process that we dubbed "auditory scene analysis" (ASA).
