Protein & peptide formulation Given the unstable nature of proteins and peptides, optimizing the stability of such therapeutics is a critical yet challenging objective of any drug development program. Resolution of such challenges enables their full therapeutic potential to be exploited, thereby ensuring optimal treatment options.

Protein & Peptide Stabilization - Drug Formulation

Protein and peptide therapeutics require parenteral administration, which can be a deterrent to medication adherence. For this reason, there have been extensive efforts to develop alternative delivery strategies, particularly for peptides such as insulin that are used to treat endocrine disorders. Oral delivery is especially desirable, but it faces substantial barriers related to the structural organization and physiological function of the gastrointestinal tract.

Cytokines are a broad and loose category of small proteins (~5–20 kDa) important in cell signaling. Cytokines are peptides and cannot cross the lipid bilayer of cells to enter the cytoplasm. Cytokines have been shown to be involved in autocrine, paracrine and endocrine signaling as immunomodulating agents. Their definite distinction from hormones is still part of ongoing research.
