Biomass torrefaction: properties, applications, challenges ...

Torrefaction is a heating process of biomass in a non-oxidizing atmosphere, necessary to improve raw biomass materials. Torrefied biomass properties include a lower moisture percentage, a higher energy density and heating value. Torrefied material is easier to grind and to pelletize. These properties all translate into a sustainable and economic higher value.

Economic analysis of biomass torrefaction plants ...

The advantages of torrefied biomass are widely recognized: better transportation characteristics and compatible properties to coal such as heating value, grindability, bulk energy density and hydrophobicity. Torrefaction is seen as a breakthrough technology to decrease the handling and storage costs and reduce investment for co-firing application.

Torrefaction Benefits - IBTC

Production costs in a medium scale stand-alone torrefaction plant of 72 800 t/a are over 40 €/MWh, and integration to an existing CHP plant does not reduce the costs substantially. The integration of torrefaction to wood industry plants results in clear savings. A production price level of 34-38 €/MWh is reached.

Biomass Pellets Torrefaction Plant

Terra Green Energy LLC, a renewable fuels technology development company in McKean County, PA, has developed a unique torrefaction facility for commercial production. Torrefaction, a "mild pyrolysis" process, transforms biomass into a form that is compatible with existing coal technology and requires less expensive storage options.

Terra Green Energy: Pioneers in Torrefaction for ...

Torrefaction is a thermal process where a biomass feedstock is heated at 200 to 300 °C in the absence of oxygen. It has also been called a mild pyrolysis process. (1) The main objective is to use the torrefied biomass ("biocoal") as a fuel, especially as a pellet for cofiring at pulverized coal power plants.

Composition, Utilization and Economic Assessment of ...

The results show that the torrefaction supply chain reaps significant economies of scale up to a plant size of about 150-200 kiloton dry substance per year (kton(DS)/year), for which the total supply chain costs accounts to 31.8 euro per megawatt hour based on lower heating value ((sic)/MWLHV).

Analysing biomass torrefaction supply chain costs - CORE

The second thing to consider in torrefaction economics is the power balance, or how much energy is needed to convert biomass into biocoal. "This is a function of your reactor technology," van der Burg explains. "In our case, it's only 2 to 2.5 percent of the total energy output.
