Difference between bonding (intramolecular) and intermolecular forces: Intramolecular forces refer to forces within a compound. Such examples of intramolecular forces would be ionic bonding (attractions between cations and anions), covalent bonding (the sharing of electrons), and metallic bonding (cations and delocalized electrons).

The easiest kind to understand are permanent dipole-permanent dipole interactions. These occur between polar molecules. A molecule is polar when there is an uneven distribution of electron density. This occurs in a bond when the atoms at each end have a different pull on the electron pair.

All intermolecular forces are van der Waals forces; that is, they are not true bonds in the sense of sharing or transferring electrons, but are weaker attractive forces. These forces include dipole-dipole forces, hydrogen bonding, and ionic interactions. Dipole-dipole forces exist between polar regions of different molecules. The presence of a dipole means that the molecule has a partially ...

Intermolecular attractions are attractions between one molecule and a neighbouring molecule. ... pointed out to me that many web and book sources and teachers describe dispersion forces as being the weakest of the intermolecular forces, quoting values of, perhaps, up to 4 kJ/mol. Boiling point is a good guide to the strength of the intermolecular forces. If these are weak, you don't need to supply much energy to break them to produce gaseous molecules, and the boiling point is low. If they are strong, you have to supply a lot of heat energy to break them, and the boiling point is high.

**THE STRENGTHS OF VAN DER WAALS DISPERSION FORCES**

The ability to use representations of molecular structure to predict the macroscopic properties of a substance is central to the development of a robust understanding of chemistry. Intermolecular forces (IMFs) play an important role in this process because they provide a mechanism for how and why molecules interact.

**Student Understanding of Intermolecular Forces: A ...**

In the cases of  $\text{NH}_3$ ,  $\text{H}_2\text{O}$  and  $\text{HF}$  there must be some additional intermolecular forces of attraction, requiring significantly more heat energy to break. These relatively powerful intermolecular forces are described as hydrogen bonds. The origin of hydrogen

**INTERMOLECULAR BONDING - HYDROGEN BONDS**

While the intramolecular forces keep the atoms in a molecule together and are the basis for the chemical properties, the intermolecular forces are those that keep the molecules themselves together and are virtually responsible for all the physical properties of a material.

**Intermolecular forces - Chemistry**

Intermolecular forces are the forces that are between molecules. And so that's different from an intramolecular force, which is the force within a molecule. So a force within a molecule would be something like the covalent bond. And an intermolecular force would be the force that are between molecules. And so let's look at the first intermolecular force. It's called a dipole-dipole interaction. And let's analyze why it has that name.

The Effects of Intermolecular Forces The intermolecular forces present in a compound play a role in that compound's properties. This isn't really surprising when you think about it.

**Chemistry: The Effects of Intermolecular Forces**

Inter molecular forces hold multiple molecules together and determine many of a substance's properties. All of the attractive forces between neutral atoms and molecules are known as van der Waals forces, although they are usually referred to more informally as intermolecular attraction.
