Vector calculus identities - Wikipedia

In the first lecture of the second part of this course we move more to consider properties of fields. We introduce three field operators which reveal interesting collective field properties, viz. the gradient of a scalar field, the divergence of a vector field, and the curl of a vector field. There are two points to get over about each: The mechanics of taking the grad, div or curl, for which you will need to brush up your multivariate calculus.

Lecture 5 Vector Operators: Grad,

Div and Curl

In vector calculus, div, grad and curl are standard differentiation operations on scalar or vector fields, resulting in a scalar or vector field. A scalar field is one that has a single value associated with each point in the domain. A simple example is a temperature distribution; every point in the domain has a single value.

4.6: Gradient, Divergence, Curl, and Laplacian ...

The vector calculus operations of grad, curl, and div are most easily generalized in the context of differential forms, which involves a number of steps. In short, they correspond to the derivatives of 0-forms, 1-forms, and 2-forms, respectively.

If we arrange div, grad, curl as indicated below, then following any two successive arrows yields 0 (or 0). functions $\rightarrow$ grad vector fields $\rightarrow$ curl vector fields $\rightarrow$ div functions. The remaining three compositions are also interesting, and they are not always zero. For a C^2

5.4 Div, Grad, Curl

First, since grad, div and curl describe key aspects of vector fields, they arise often in practice, and so the identities can save you a lot of time and hacking of partial derivatives, as we will see when we consider Maxwell's equations as an example later. Secondly, they help to identify other practically important vector operators.
