Indoor Visible Light Communication Without Line Of Sight

Abstract. Visible light communication (VLC), which uses LEDs for both lighting and communication purposes, has recently emerged as an alternative or support system to radio frequency (RF) communication. VLC channel between LEDs and photo-diodes is highly variable and pretty much depends on optical line of sight (LOS) and field of view (FOV).

Title Visible light communication for indoor monitoring (VLADIMIR) Lighting is present in most indoor areas. Apart from illumination, lighting infrastructure can be used for data communication using Visible Light Communication (VLC) technology. VLC encodes the data into fast changes on the intensity of the LED light and, at the receiver, these intensity fluctuations are detected using a Photodiode.
