Spectroscopy. Infrared spectroscopy. Infrared spectroscopy can be used to identify certain functional groups in an organic compound. The wavelengths which are absorbed to cause the vibrations (stretches and bends) will depend on the type of chemical bond and the groups or atoms at the ends of these bonds.

In a modern infrared spectrometer, a beam of infrared radiation is passed through a sample of the chemical to be identified.

Computer analysis enables the absorbance of radiation to be measured at different frequencies. Study of the resulting spectrum enables the presence (or absence) of particular functional groups to be established.

Modern analytical techniques - Chemistry

In general, spectroscopy is the study of the interaction between light and matter. Infrared spectroscopy is a particular technique that can be used to help identify organic (carbon-based) compounds. Visible light is just a portion of the electromagnetic spectrum, and it's the infrared section of the spectrum that's utilised in this technique.

Analytical Chemistry - Infrared (IR) Spectroscopy ...

Infrared Spectroscopy generally refers to the analysis of the interaction of a molecule with infrared light. The IR spectroscopy concept can generally be

analyzed in three ways: by measuring reflection, emission, and absorption.

Modern Chemical Techniques is based on a series of 'hands-on' symposia that enabled individuals to update their chemical skills and learn about the newest methods, techniques, and instrumentation available. The resource material presented at the symposia is published here, developed and extended into an accessible, illustrated book, making the valuable information it contained available to a much wider audience.

This is a worksheet I designed for AS level students, guiding them through looking at, analysing and predicting IR spectra for simple organic molecules. It also gives a few problem solving situations combining data from mass spectra and IR spectra to find the structure of simple organic molecules. The teacher guidance has the answers to the problem solving questions at the bottom, should you need them.

This significantly increased the use of the derivative

technique. The derivative method has found its applications not only in UV-spectrophotometry but also in infrared (McWilliams, 1969), atomic absorption, fluorescence spectrometry (Snelleman et al., 1970, Konstantianos et al., 1994), and fluorimetry (O'Haver, 1976, John and Soutar, 1976). The use of derivative spectrometry is not restricted to special cases, but may be of advantage whenever quantitative study of normal spectra is problematic.
