Diabetic Foot Infections Bacterial Isolates
RESEARCH DESIGN AND METHODS This is a prospective study in which the infected wounds of 25 consecutive diabetic patients seen by one of the authors were cultured as they entered the hospital. Isolates were stored and tested for susceptibility to 10 oral antimicrobial agents using the agar dilution method. RESULTS Staphylococcus aureus was the most common isolate (76% of patients), including methicillin-resistant S. aureus (MRSA) in 5 of 25 (20%) patient wounds.

Diabetic Foot Infections: Bacteriology and activity of 10 ...
Bacterial isolates cultured from diabetic foot infections in Ile-Ife, Nigeria Aerobic Gram-positive bacteria accounted for 50 (32.8%) of which 27 (54%) were cultured from superficial swabs and 23 (46%) from deep tissue biopsies. Among these aerobic Gram-positive bacterial isolates, cocci accounted for 42 (84%).

Characterization of bacterial isolates from diabetic foot ...
Aims: The polymicrobial nature of diabetic foot infection has been well documented in the literature. Patients with diabetic foot infection not exposed to antibiotics are not well studied before. The relative frequency of bacterial isolates cultured from community-acquired foot infections that are not exposed to antimicrobial agents for 30 days is studied.

Bacteriological study of diabetic foot infections

We discovered that the most common single pathogen isolation in diabetic foot infections was *S. Aureus* [11, 20, 21]. The prevalence of *S. Aureus* was 76 and 78% in studies according to Goldstein et al. and Kajetan et al. [21,22,23]. However, we have reported a much lower prevalence when compared with earlier reports.

Clinical and bacteriological profile of diabetic foot ...

A total of 112 microbial isolates were included. Predominance of Gram-positive bacteria was observed and 22.3% of isolated bacteria were MDR. Previous hospitalisation was associated with a higher likelihood of MDR infection. MDR bacterial infection was also associated with an increased LOS ($P = .0296$). Our study showed a high incidence of MDR bacteria in patients with a DFI, especially in those who had a recent hospitalisation.

Multidrug-resistant bacteria in diabetic foot infections ...

CONCLUSIONS: MRSA and enterococci are now a common cause of diabetic foot infections, and the increased prevalence may be due to antimicrobial use. These wounds may require use of combined antimicrobial therapy for initial outpatient management. The new fluoroquinolones, sparfloxacin and levofloxacin, were the most active oral agents tested.

Diabetic foot infections. Bacteriology and activity of 10 ...

Enterococcus species were isolated nearly as frequently (21 isolates) as *S.aureus* (25 isolates). The majority of studies also noted a high frequency of these microorganisms in foot infections of diabetic patients (1, 2, 18). Compared with earlier reports, we recovered fewer anaerobic species (1, 18).

A Clinico-microbiological Study of Diabetic Foot Ulcers in ...

Osteomyelitis is a frequent complication of diabetic foot infections (DFI) and is related to more than 20% of moderate infections and 50–60% of severe infections (Lipsky et al., 2016). DFI is also a well-recognized risk factor for major amputation in diabetic patients (Lavery et al., 2006).

Exploring the Microbiota of Diabetic Foot Infections With ...

Key Points • Diabetic foot infections are often caused by gram-negative bacteria. Polymicrobial infections are also common. Incidentally, only gram-positive bacteria are least likely to be isolated. • There is a rising prevalence of MDR pathogens in diabetic foot infections.

Microbiological study of diabetic foot infections

Gangrene is a serious medical condition that comes in two type, known as “wet” and “dry” gangrene. They are caused by bacterial infections or pre-existing health-issues respectively. Unfortunately, diabetics are at risk of both types.

Foot Wounds and Infections - Diabetes

Some of the aerobic bacteria associated with diabetic foot infection include *Staphylococcus aureus*, *S. saprophyticus*, *S. epidermidis*, *Streptococcus pyogenes*, *S. mutans*, *Pseudomonas aeruginosa*,

Bacillus subtilis, *Proteus* species, *Escherichia coli* and *Klebsiella pneumoniae*.

Aerobic bacteria associated with diabetic foot ulcers and ...

Diabetic foot ulcers (DFUs) are a serious and common problem in patients with diabetes mellitus and constitute one of the major causes of lower extremity amputation. The microbiological profile of DFUs depends on the acute or chronic character of the wound. Aerobic gram-positive cocci are the predominant organisms isolated from DFUs.

Bacterial Prevalence and Antibiotic Resistance in Clinical ...

Staphylococcus aureus was the predominant pathogen, which comprised 57.2% and 73.6% of their isolates respectively. Therefore, there seems to be a changing trend in the organisms causing diabetic foot infections, with gram-negative bacteria replacing gram-positive bacteria as commonest agents.

Diabetic foot Infection: Microbiological Causes with ...

Wound infection: definition, process and prognosis. Foot wounds are an increasingly common problem in people with diabetes and now constitute the most frequent diabetes-related cause of hospitalization [1]. People with diabetes have about a 25% chance of developing a foot ulcer in their lifetime [1], about half of which are clinically infected at presentation [2,4].

Microbiology of diabetic foot infections: from Louis ...

Diabetic foot infections in developed countries are usually caused by aerobic Gram-positive cocci [5, 6], but deep or chronic wounds often harbor both aerobic Gram-negative and obligate anaerobic bacteria [7]. Moreover, when the infection is chronic or have been previously treated with antibiotics, DFI are more commonly polymicrobial [6, 8].

Evolutionary trends in bacteria isolated from moderate and ...

Vancomycin resistance among *Staphylococcus aureus* is a frequent phenomenon and in fact, the first two isolates of Vancomycin resistant *S. aureus* were isolated from diabetic patients with foot lesion (Chang et al., 2003). Similarly all the isolates of *Pseudomonas* sp., and *E. coli* in the present study also showed resistance to Vancomycin.
