Direct variation problems are solved using the equation $y = kx$. In this case, you should use c and d instead of x and y and notice how the word “square root” changes the equation. Step 2 : Use the information given in the problem to find the value of k.

Solving Direct Variation Problems

DIRECT VARIATION A linear equation of the form $y=kx$ with $k \neq 0$ is called direct variation. The variable y varies directly with the variable x. In other words, the variables change at the same rate: If the value of one variable doubles, the value

of other variable doubles, if one value triples, the other triples.

Direct and Inverse Variation

Solution: $y \propto x^3$ that is $y = kx^3$ where k is a constant. Substitute $x = 3$ and $y = 21$ into the equation: $21 = k (3^3) \Rightarrow k = \frac{21}{27}$. So, $y = \frac{7}{9}x^3$. When $x = 8$, The following video gives some practical examples of direct variation and indirect/inverse variation. Show Video Lesson.
