Following electrophoresis, the separated antigens are reacted with specific antisera placed in troughs parallel to the electrophoretic migration and diffusion is allowed to occur. Antiserum present in the trough moves toward the antigen components resulting in the formation of separate precipitin lines in 18-24 hrs, each indicating reaction between individual proteins with its antibody.

Key Difference - Capillary Electrophoresis vs Gel Electrophoresis Electrophoresis is a technique that is used to separate biomolecules based on the particle charge, particle size, and the particle shape. The migration of the molecule, known as electrophoretic mobility, depends on the type of polymer/gel used, its pore size, the voltage provided, running time and the surface to volume ratio.
