Bending moment and shear force diagram of a cantilever beam

The cantilever beam is one of the most simple structures. It features only one support, at one of its ends. The support is a, so called, fixed support that inhibits all movement, including vertical or horizontal displacements as well as any rotations. The other end is unsupported, and therefore it is free to move or rotate.

The bending moment of a cantilever beam is maximum at the fixed end and decreases to zero at the free end. The bending and shear force diagram is determined for all possible load combinations to design a cantilever beam for a structure. The load applied on the beam is a combination of dead load and live loads as per the design standards.
