However, it has no finite subcover, which contradicts the compactness of B . 1-20 Assume $A \subseteq \mathbb{R}^n$ is not bounded. Then $\bigcup_{k=1}^{\infty} (-k, k)^n = (-\infty, \infty)^n$ is an open cover of A that has no finite subcover, a contradiction. Now assume A is not closed -- that is, there is a point $x \notin A$ on A 's boundary.

Step1: We divide the square $[0;1] \times [0;1]$ into four equal squares by connecting $(1/2;0)$ and $(0;1/2)$, $(0;1/2)$ and $(1;1/2)$. We place on point in each of the squares and make sure no two points are on the same horizontal or vertical line. Step n: We divide each of the squares obtained in Step (n-1) into four equal squares.

Calculus On Manifolds Spivak Solutions Then, by one-variable calculus (in particular the Mean Value Theorem, see e.g. Apostol) $\frac{\partial f}{\partial x_1}(x,y_1) = \frac{\partial f}{\partial x_1}(x,y_2)$ for all (x,y_1,y_2) . That is, $\frac{\partial f}{\partial x_1}$ is independent of the second variable. If in addition $\frac{\partial f}{\partial x_1} = 0$, then $\frac{\partial f}{\partial x_1}$ is constant in both variables by similar reasoning.

4 CHAPTER 1 FUNCTIONS ON EUCLIDEAN SPACE I Exercise 8 (1-8). If $x,y \in \mathbb{R}^n$ are non-zero, the angle between x and y , denoted $\angle(x,y)$, is defined as $\arccos \frac{x \cdot y}{\|x\| \|y\|}$, which makes sense by Theorem 1-1 (2). The linear transformation T is angle preserving if T is 1-1, and for $x,y \neq 0$ we have $\angle(Tx,Ty) = \angle(x,y)$. a. Prove that if T is norm preserving, then T is angle preserving. b.
