The rate of decay is a fixed rate called a half-life. The half-life of a radioactive isotope refers to the amount of time required for half of a quantity of a radioactive isotope to decay. Carbon-14

has a half-life of 5730 years, which means that if you take one gram of carbon-14, half of it will decay in 5730 years. Different isotopes have different half-lives.

Explain your answer. Half-life means that half of a sample decays after one half-life and the rest of the sample decays after the next half-life. One reason it is important to know the half-life of a sample is to safely dispose of radioactive waste, which is usually stored for 10

half-lives.
