The purpose of this course is to provide a framework for graduate students to understand at an "advanced" level some of the important aspects of the physics of condensed matter. We will build upon the material typically included in the previous course, Physics 560, which describes many of the important properties of solids in terms of non-interacting independent particles.

Condensed matter physics is the field of physics that deals with the macroscopic and microscopic physical properties of matter, especially the solid and liquid phases which arise from electromagnetic forces between atoms. More generally, the subject deals with "condensed" phases of matter, systems of very many constituents with strong interactions between them. More exotic condensed phases include the superconducting phase
