Introduction To Hilbert Spaces

The notion of a Hilbert space is a central idea in functional analysis and can be used in numerous branches of pure and applied mathematics. Dr. Young stresses these applications particularly for the solution of partial differential equations in mathematical physics and to the approximation of functions in complex analysis.

A Hilbert space is a vector space equipped with an inner product, an operation that allows defining lengths and angles. Furthermore, Hilbert spaces are complete, which means that there are enough limits in the space to allow the techniques of calculus to be used.

2. Hilbert spaces A Euclidean space is a vector space endowed with the inner product norm $\| \cdot \|$ and associated metric $d(x,y) = \|x - y\|$, such that every Cauchy sequence takes a limit in This makes a Hilbert space: Definition 7. An RKHS is a Hilbert space (Akhiezer and Glazman:1963) in which all the point evaluations are bounded linear functionals. (Unlike L^2 .) Letting H be a Hilbert space of functions on some domain T , this means, that for every $t \in T$ there exists an element $\delta_t \in H$, such that $f(t) = \langle \delta_t, f \rangle$; $\|\delta_t\| = 1$; where $\langle \cdot, \cdot \rangle$ is the inner product in H . Let $\langle s, t \rangle =$

A Hilbert space is a special type of vector space. Its definition will require the generalized notion of length and distance in a vector space. For this we will require an inner or scalar product ($\langle \cdot, \cdot \rangle : V \times V \rightarrow \mathbb{R}$) which will lead us to a norm and metric.
