Movement of the swash plate controls pump output from zero to maximum. There are two kinds of variable-displacement axial piston pumps: direct displacement control pump, a kind of axial piston pump with a direct displacement control. A direct displacement control uses a mechanical lever attached to the swashplate of the axial piston pump. Higher system pressures require more force to move that lever, making direct displacement control only suitable for light or medium duty pumps.

An axial piston pump of a type having a swash plate and a rotatable cylinder block is known. An axial piston pump of the kind of a variable displacement which is carried out by changing an angle of the swash plate is shown in Japan Patent Application Laid-open No. 50681/1988.

Swash plate type axial piston pump - Zexel Corporation

The axial piston pump drives a series of pistons aligned parallel with a shaft through a swashplate to pump a fluid. A common

example of a swashplate application in a fluid pump is the compressor of a present-day automobile air conditioning system. By varying the angle of the swashplate, the pistons' stroke (and, therefore, the compressor's cooling capacity) can be dynamically adjusted.

This article is a follow up, focused on a piston assembly of a swashplate type axial piston pump. The pictures show a classic piston shoe design, although the hydraulic balance principle is equally applied to the "inverted" piston design, where the "ball" is part of the shoe (Linde, Komatsu..), the

solution that allows a bigger swash-plate angle and therefore a more compact pump design.
