generalization of the
method used by

Bernoulli (GBM method) to find the differential equation that satisfies the brachistochrone. A relevant fact is that Bernoulli's method is based in the techniques of the elementary calculus.

Generalization of Bernoulli numbers are defined starting from suitable generating function. The number sequences of Euler, Genocchi, Stirling and others, as well as the tangent numbers, secant numbers are closely related to the Bernoulli numbers. The same is true for the numerous generalizations and expansions of the Bernoulli numbers and

A GENERALIZATION OF THE BERNOULLI NUMBERS

This relation is valid even in the nonhydrostatic limit and in the presence of arbitrary nonconservative forces (such as internal friction) and heating rates. In essence, it can be interpreted as a generalization of Bernoulli's theorem to the frictional and diabatic regime. The classical Bernoulli theorem—valid for inviscid adiabatic and steady flows—states that the intersections of surfaces of constant potential temperature and constant Bernoulli function yield streamlines.

polynomials $B_n(x)$ are usually defined (see, e.g.,) by means of the generating function - 1. Introduction text $G(x, t) := e^{xt} - 1 = (1.1)$ and the Bernoulli numbers $B_n := B_n(0)$ by the corresponding equation $t e^{xt} - 1 = \sum_{n=0}^{\infty} B_n \frac{t^n}{n!}$. The B_n are rational numbers.

ABSTRACT In this note, we propose a generalization of the famous Bernoulli differential equation by introducing a class of nonlinear first-order ordinary differential equations (ODEs). We provide a family of solutions for this introduced class of ODEs and also we present some examples in order to illustrate the applications of our result.

For the Bernoulli and binomial distributions, the parameter is a single probability, indicating the likelihood of occurrence of a single event. The Bernoulli still satisfies the basic condition of the generalized linear model in that, even though a single outcome will always be either 0 or 1, the expected value will nonetheless be a real-valued probability, i.e. the probability of occurrence ...

Abstract This paper presents a new departure in the generalization of the binomial distribution by adopting the assumption that the underlying Bernoulli trials take on the values α or β where $\alpha < \beta$, rather than the conventional values 0 or 1.

On the other hand, if we take $\lambda = 1$ in , we have another new generalized Bernoulli polynomials given by (1.3) $t b t-a t \alpha c t x = \sum_{n=0}^{\infty} B_n(\alpha)(x; a, b) \frac{t^n}{n!}$, which, for special case $\alpha = 1$, yields the Bernoulli polynomials studied by Luo et al. , .

In mathematics, Bernoulli's inequality is an inequality that approximates exponentiations of $1 + x$. It is often employed in real analysis. The inequality states that $r \geq 1 + r x$ $\{\displaystyle ^{\{r\}}\geq 1+rx\}$ for every integer $r \geq 0$ and every real number $x \geq -1$. If the exponent r is

even, then the inequality is valid for all real numbers x . The strict version of the inequality reads $r > 1 + r x^{\frac{1}{r}}$ for every integer $r \geq 2$ and every real number $x \geq -1$ with $x \neq 0$.

Bernoulli's inequality -

One generalization of the Bernoulli trials hierarchy in Example 4.4.6 is to allow the success probability to vary from trial to trial, keeping the trials independent. A standard model for this situation is $X_i | P_i \sim \text{Bernoulli}(P_i)$, $i = 1, \dots, n$, $P_i \sim \text{beta}(\alpha, \beta)$
