VHDL is a hardware description language (HDL). An HDL looks a bit like a programming language, but has a different purpose. Rather than being used to design software, an HDL is used to define a computer chip. VHDL can be used to describe any type of circuitry and is frequently used in the design, simulation, and testing of processors, CPUs, mother boards, FPGAs, ASICs, and many other types of digital circuitry.

A specification, often incomplete and written in non-formal languages, is developed and sent to the hardware and software engineers. Hardware-software partition is decided a priori and is adhered to as much as is possible, because any changes in this partition may necessitate extensive redesign. Designers often strive to make everything fit in software, and off-load only some parts of the design to hardware to meet timing constraints. The problems with these design methods

Hardware Software Co-Design. August 30, 2013 By Naman Govil.

Hardware/software partitioning is the problem of dividing an application's computations into a part that executes as sequential instructions on a microprocessor (the "software") and a part that runs as parallel circuits on some IC fabric like an ASIC or FPGA (the "hardware"), such as to achieve design goals set for metrics like performance,

power, size, and cost.

Abstract. The hardware and software co-design for five axes robot arm, is aimed to perform pick and place operation by

controlling the speed and position, using FPGA, H-bridge driver and Sensor circuit. Digital PWM is used to control speed of DC motor. The hardware functional block designed in software module with the help of VHDL coding as FPGA technology has blurred the distinction between hardware and software.
