First Order Differential Equation Solution

A first-order differential equation is defined by an equation: $dy/dx = f(x, y)$ of two variables x and y with its function $f(x, y)$ defined on a region in the xy -plane. It has only the first derivative dy/dx so that the equation is of the first order and no higher-order derivatives exist. The differential equation in first-order can also be written as;

The most general first order differential equation can be written as, $dy/dt = f(y, t)$ (1) (1) $d y d t = f(y, t)$ As we will see in this chapter there is no general formula for the solution to (1) (1). What we will do instead is look at several special cases and see how to solve those.

The differential equation in the picture above is a first order linear differential equation, with $P(x) = 1$ and $Q(x) = 6x^2$. We'll talk about two methods for solving these beasties. First, the long, tedious cumbersome method, and then a short-cut method using "integrating factors". You want to learn about integrating factors!
