Optical Coherence Tomography A Clinical

Optical coherence tomography (OCT) is an imaging technique that uses low-coherence light to capture micrometer-resolution, two- and three-dimensional images from within optical scattering media (e.g., biological tissue). It is used for medical imaging and industrial nondestructive testing (NDT). Optical coherence tomography is based on low-coherence interferometry, typically employing near-infrared light.

Optical coherence tomography - Wikipedia

Optical coherence tomography (OCT) is a new imaging technique which is capable of producing cross-sectional images of the retina with a resolution that surpasses that of conventional imaging techniques. This new technique has axial resolution of around 10 µm and can resolve individual retinal layers, thus providing information on retinal structure.

Optical coherence tomography: evaluation and clinical ...

Introduction. Since optical coherence tomography (OCT) was first demonstrated in 1991 (Huang et al. 1991), it has rapidly evolved as the only

non-invasive diagnostic technique able to provide images of the retinal microstructure. OCT is arguably one of the most innovative and rapidly evolving optical imaging technologies in recent history (Huang et al. 1991).

An optical coherence tomography scan (commonly referred to as an OCT scan) helps us to view the health of

your eyes in greater detail, by allowing us to see what's going on beneath the surface of the eye. Imagine it like a cake – we can see the top of the cake and the icing using the 2D digital retinal photography (fundus camera), but the 3D image produced from an OCT scan slices the cake in half and turns it on its side so we can see all the layers inside.

High-resolution frequency domain optical coherence tomography (OCT) stands out amongst a range of novel dermatologic imaging technologies, with its good detection sensitivity around -100 dB, high measurement

speeds allowing real-time image acquisition and its ability to acquire high definition crosssectional and 3D tomograms of regions greater than 1 cm², providing tissue information comparable to conventional histopathology without the need for any contrast agents.
