kelvinA unit of measurement for temperature. It is one of the seven base units in the International System of Units (SI). FahrenheitAn unit of measurement for temperature used most commonly in the United States. CelsiusA scale and unit of measurement for temperature where 0 °C is the freezing point of water. Also known as centigrade.

Temperature | Introduction to Chemistry

Charles's Law states that the volume of a given mass of gas varies directly with the absolute temperature of the gas when pressure is kept constant. The absolute temperature is temperature measured with the Kelvin scale. The Kelvin scale must be used because zero on the Kelvin scale corresponds to a complete stoppage of molecular motion.

Temperature is a measure of the internal energy of a system, while heat is a measure of how energy is transferred from one system (or body) to another, or, how temperatures in one system are raised or lowered by interaction with another. This is roughly described by the kinetic theory, at least for gases and fluids.

A thermometer is a device that measures temperature. The name is made up of “thermo” which means heat and “meter” which means to measure. The temperature of a substance is directly proportional to the average kinetic energy it contains. In order for the average kinetic energy and temperature of a substance to be directly proportional, it is necessary that when the temperature is zero, the average kinetic energy must also be zero.

Chapter 1: Measurements in Chemistry - Chemistry

Temperature itself is the measurement of the average kinetic energy of a substance. The kinetic energy arises from the motion of atoms and molecules, and it is postulated that at absolute 0, there is no motion and therefore, no kinetic energy.

Among many alternative units that might be considered as a measure of time is the shake rather than the second. Based on the expression "faster than a shake of a lamb's tail," we'll define 1 shake as equal to 2.5×10^{-4} s. If a car is traveling at $55 \text{ mi} / \text{h}$, what is its speed in cm / shake ?

Measurements provide quantitative information that is critical in studying and practicing chemistry. Each measurement has an amount, a unit for comparison, and an uncertainty.

Measurements can be represented in either decimal or scientific notation. Scientists primarily use the SI (International System) or

metric systems.

Measurable properties fall into one of two categories. Extensive properties depend on the amount of matter present, for example, the mass of gold. Intensive properties do not depend on the amount of matter present, for example, the density of gold. Heat is an example of an extensive property, and temperature is an example of an intensive property.

A mercury thermometer can measure temperatures ranging from -10°C to 110°C , with each division measuring 1°C change in temperature. It has an accuracy of $\pm 0.5^{\circ}\text{C}$, is cheap and easy to use. A data logger is more commonly used in field experiments where the data is collected over long periods.
