In fact, migratory ectoparasite PPN such as *Helicotylenchus oleae* and *Ogma rhombosquamatum* showed the highest nematode abundance (19,720 and 9800 nematodes per 500 cm³ of soil, respectively); however, a rare (low prevalence) of sedentary endoparasitic PPN species such as *Meloidogyne javanica* was also detected at a high nematode abundance, i.e. 10,000 nematodes per 500 cm³ of soil.

Dataset on the diversity of plant-parasitic nematodes in ...

The prevalence and diversity of plant parasitic nematodes in Northern Ireland cereal and grassland was determined from 191

agricultural fields. A total of 18 nematode genera were detected, including economically important pests, *Meloidogyne* spp., *Heterodera* spp. and *Pratylenchus* spp., each of which were above economic damage thresholds in a significant proportion of the sites (92.4%, 70% and 28.6%, respectively).

Rice presented the highest nematodes diversity with 20 species belonging to 12 genera, following by Maize with 15 nematodes species belonging to 9 genera, and sorghum with 9 nematodes species belonging to 7 genera (Table. 2). Around 90% of the nematode species associated with maize and sorghum are parasites of rice.

Diversity and characterization of

plant parasitic ...

The root-knot nematodes (*Meloidogyne* spp.) and the root-lesion nematode (*Pratylenchus* spp.) were the most prevalent PPNs. Vegetable crops (bean, onion, and tomato) had high nematode diversity indices compared to some aromatic and medicinal crops, including the Shannon, Evenness, and plant parasitic index (PPI).

Diversity and Management Strategies of Plant Parasitic ...

There are species of nematodes that feed on fungi, bacteria, protozoans, other nematodes, and plants. They can also parasitize insects, humans, and animals.

Nematodes that feed on plant parts are called plant parasitic nematodes (PPN) and are ubiquitous in agricultural soils. The life cycle of a nematode includes eggs, juveniles and adults, and they can overwinter at any of these stages.

Plant Parasitic Nematodes Explained

With the exception of resting spores of bacteria and fungi we might expect that biodiversity of different taxa of soil biota are correlated; that is, that a high diversity of mites, collembola or protozoa under stable conditions is correlated with high nematode diversity because they are each determined by the stability of the system.

Functional diversity of nematodes - ScienceDirect

Thirteen species of plant parasitic nematodes within nine genera were isolated and identified from roots and soil around cashew nut shrubs.

They were:

Helicotylenchus astriatus, *H. dihystra*, *H. elegans*, *Hemicriconemoides mangiferae*, *Hoplolaimus indicus*, *Meloidogyne incognita*, *Pratylenchus coffeae*, *P. brachyurus*, *Rotylenchulus reniformis*, *Scutellonema brachyurus*, *Tylenchorhynchus leviterminalis*, *Xiphinema brevicolle* and *X. neoamericaum*.

Biodiversity of plant parasitic nematodes of cashew ...

The biodiversity of nematodes has been investigated in various ecosystems, including deep sea and Antarctic environments (Velasco-Castrillon & Stevens, 2014; Dell'Anno et al., 2015). Plant-parasitic nematodes act as soil indicators in terms of function and soil biodiversity (Yeates, 2003).

Molecular biodiversity assessment of plant-parasitic ...

County Bam, with a higher quality of alfalfa (Tadayyon and Zafarian, 2016), also had the highest plant-parasitic nematode diversity, and therefore, crop production practices known to promote high plant-parasitic diversity should be practiced. Environmental

conditions were shown to affect the diversity of plant-parasitic nematodes in Kerman Province, as shown by the PCA, but detailed studies on this topic are needed.

Collectively, plant-parasitic nematodes cause over \$150 billion in crop losses each year worldwide. The

situation is particularly dire in the developing world, and the nematodes we are studying are among the most severe parasites. In the United States alone, severe economic damage is common where root-knot and cyst nematodes occur.

This study recorded the abundance and prevalence of plant-parasitic nematodes from 25 localities across south-west Nigeria during 2016/2017. Of the 11 nematode species identified, those belonging to *Meloidogyne* spp. were predominant according to Prominence Values, followed by *Helicotylenchus dihystra*, *Pratylenchus zeae* and *Scutellonema bradys*.

Abundance and diversity of plant-parasitic nematodes

...

Plant-parasitic nematodes represent a major threat to the agricultural production

of different crops worldwide. Due to the high toxicity of chemical nematicides, it is necessary to develop new control strategies against nematodes. In this respect, filamentous fungi can be an interesting biocontrol alternative.

Biological Control of Plant-Parasitic Nematodes by ...

Approximately 16 species from 13 genera, 7 families, 3 super families, 2 suborders, 3 orders

and 2 classes of plant parasitic nematodes have been recorded. Community analysis of the survey revealed that *Helicotylenchus multicinctus* had the highest prominence value (PV) in two districts, namely Theni and Tirunelveli, whereas the reniform nematode, *Rotylenchulus reniformis* was the most predominant nematode in Kanyakumari and Dindigul districts with PV of 143.6 and 154.8, respectively.
