The Dental Pulp - Biology, Pathology, and Regenerative ...

Preface. The dental pulp has the characteristic of being exclusively the nonmineralized part of a mineralized tooth. This tissue is surrounded by a robust shelllike complex structure that includes dentin and enamel in the crown and cementum in the root. Like most connective tissues, the dental pulp is vascularized and innervated, which constitute important functional differences between the crown and the root.

The Dental Pulp | SpringerLink

The dental papilla is the origin of dental pulp. Cells at the periphery of the dental papilla undergo cell division and differentiation to becomes odontoblasts. Pulpoblasts forms in the middle of the pulp. This completes the formation of the pulp. The dental pulp is essentially a mature dental papilla. The development of dental pulp can also be split into two stages:

Because of the unique encasement of the human dental pulp in a low-compliance environment, intrapulpal tissue pressure is of paramount importance in pulpal physiology. Tissue pressure is a local phenomenon, and the pathophysiology of pulp is characterized not by a sudden strangulation at the apex but by a circumferential spread of inflammation and necrosis from a site of initial injury.
