4 5 Nodes represent the neurons, and arrows represent the links between them. Each node has its number, and a link connecting two nodes will have a pair of numbers (e.g. (1,4) connecting nodes 1 and 4). Networks without cycles (feedback loops) are called a feed-forward networks (or perceptron).

Feedforward neural networks were among the first and most successful learning algorithms. They are also called deep networks, multi-layer perceptron (MLP), or simply neural networks. As data travels through the network's artificial mesh, each layer processes an aspect of the data, filters outliers, spots familiar entities and produces the final output. Feedforward neural networks are made up of the following:

Mathematically, a feed-forward neural network defines a mapping $y = f(x; \theta)$ and learns the value of the parameters θ that helps in finding the best function approximation. Note: There is also a bias unit in a feed-forward neural network in all the layers except the output layer. Biases are extremely helpful in successful learning by shifting the activation function to the left or to the right.

Feedforward Neural Networks. Multi-layered Network of neurons is composed of many sigmoid neurons. MLNs are capable of handling the non-linearly separable data. The layers present between the input and output layers are called hidden layers. The hidden layers are used to handle the complex non-linearly

separable relations between input and the output.

Deep Learning: Feedforward Neural Networks Explained

...

A feedforward neural network is an artificial neural network wherein connections between the nodes do not form a cycle. As such, it is different from its descendant: recurrent neural networks. The feedforward neural network was the first and simplest type of artificial neural network devised. In this network, the information moves in only one direction—forward—from the input nodes, through the hidden nodes and to the output nodes. There are no cycles or loops in the network.

Feedforward neural network - Wikipedia

Neural networks is an algorithm inspired by the neurons in our brain. It is designed to recognize patterns in complex data, and often performs the best when recognizing patterns in audio, images or video. Neurons — Connected. A neural network simply consists of neurons (also called nodes). These nodes are connected in some way.
