A stochastic process is a collection of random variables $X = \{X_t; t \in T\}$ where, for each fixed $t \in T$, X_t is a random variable from (Ω, F, P) to (E, G) . Ω is known as the sample space, where E is the state space of the stochastic process X_t . The set T can be either discrete, for example the set of positive integers Z^+ , or continuous, $T = R^+$.

STOCHASTIC PROCESSES AND APPLICATIONS

Four stochastic processes are included in Risk Simulator's Forecasting tool, including geometric Brownian motion or random walk, which is the most common and prevalently used process due to its simplicity and wide-ranging applications. The other three stochastic processes are the mean-reversion process, jump-diffusion process, and a mixed process.

Sample continuity. An Itô diffusion X is a sample continuous process, i.e., for almost all realisations $B_t(\omega)$ of the noise, $X_t(\omega)$ is a continuous function of the time parameter, t . More accurately, there is a "continuous version" of X , a continuous process Y so that $[Y] = [X]$. This follows from the standard existence and uniqueness theory for strong solutions of stochastic differential equations.
