The radial force (centripetal force) is due to the change in direction of velocity as discussed earlier. In non-uniform circular motion, normal force and weight may point in the same direction. Both forces can point down, yet the object will remain in a circular path without falling straight down.

Circular motion - Wikipedia
Nonuniform Circular Motion. Any object moving in a circle -- or just a part of a circle -- has a centripetal acceleration, directed toward the center of that circle. That means it has a centripetal force acting on it, also directed toward the center of that circle. "Directed toward the center" can also be stated as "radially". That is, any object moving in a circle -- or just a part of a circle -- has a

This equation shows that the net force required for an object to move in a circle is directly proportional to the square of the speed of the object. For a constant mass and radius, the F_{net} is proportional to the speed². The factor by which the net force is altered is the square of the factor by which the speed is altered.

Mathematics of Circular Motion - Physics Classroom
A radial force is a force acting on an object which moves in a circle which is parallel to the line from the centre of the circle to the point where the object is on the circumference of the circle. An example is the tension in a string when an object at the end of a string is spun so it has constant angular velocity.

What is radial force and how would it be calculated? - Quora
Radial forces are an important component of the process that keeps any object traveling in a circular orbit. When a known mass (such as a ball) spins around in a circle a set distance (the radius) from the center point at a constant speed, the radial force pushes the mass out, away from the center.

What is Radial Force? (with picture) - wiseGEEK
The animation at the right depicts this by means of a vector arrow. The final motion characteristic for an object undergoing uniform circular motion is the net force. The net force acting upon such an object is directed towards the center of the circle. The net force is said to be an inward or centripetal force.

Centripetal force is a net force is the sum of the force vectors pointing in the radial direction. It could be the component of a force, the sum of multiple forces, or the difference of two radial vectors.
