Multiphase Flow and Transport Processes in the Subsurface ...

In fluid mechanics, multiphase flow is the simultaneous flow of materials with two or more thermodynamic phases. Virtually all processing technologies from cavitating pumps and turbines to paper-making and the construction of plastics involve some form of multiphase flow. It is also prevalent in many natural phenomena. These phases may consist of one chemical component, or several different chemical components. A phase is classified as continuous if it occupies a continually connected region of

Traditionally, complex problems of multiphase flow and transport in porous media are tackled by a multiphase approach, Abriola and Pinder [10], in which various phases are regarded as distinct fluids with individual thermodynamic and transport properties and with different flow velocities. The transport phenomena are mathematically described by the basic principles of conservation for each phase separately and by appropriate interfacial conditions between various phases.
