Nonlinear Optics - 3rd Edition

Nonlinear optics (NLO) is the branch of optics that describes the behaviour of light in nonlinear media, that is, media in which the polarization density P responds non-linearly to the electric field E of the light. The non-linearity is typically observed only at very high light intensities (values of atomic electric fields, typically 10^8 V/m) such as those provided by lasers.

Boyd’s book, “Nonlinear Optics,” uses SI units and defines a sinusoidal linearly polarized electric field to be of the form, $\vec{E}(t) = \hat{E} \exp(-i\omega t) + \text{c.c.}$ (1.14) I prefer the fields to be of the form $\cos\omega t$ rather than $2\cos\omega t$, so I will use the convention, $\vec{E}(t) = 1/2$

Nonlinear Optics

Nonlinear optical phenomena are

“nonlinear” in the sense that they occur when the response of a material system to an applied optical field depends in a nonlinear manner on the strength of the optical field. In nonlinear optics, the optical response can be described by expressing the polarization as a power series in the field strength.
