Economic dispatch is the short-term determination of the optimal output of a number of electricity generation facilities, to meet the system load, at the lowest possible cost, subject to transmission and operational

constraints. The Economic Dispatch Problem is solved by specialized computer software which should satisfy the operational and system constraints of the available resources and corresponding transmission capabilities.

Economic Dispatch The KKT conditions thus result in the following dispatch rules: $dF_i/dp_i = \lambda$, $p_i^{\min} < p_i < p_i^{\max}$, $dF_i/dp_i \geq \lambda$, $p_i = p_i^{\max}$, $dF_i/dp_i \leq \lambda$, $p_i = p_i^{\min}$. The Lagrange multiplier, λ , is the marginal cost of supplying energy to the system and it has units of \$/megawatt-hour or cents/kilowatt-hour.

Economic Dispatch and Introduction to Optimisation

INTRODUCTION□ In power generation our main aim is to generate the required amount of power with minimum cost.□ Economic load dispatch means that the generator's real and reactive power are allowed to vary within certain limits so as to meet a particular load demand with

minimum fuel cost□ This allocation of loads are based on some constraints.
