Testing and analysing is strongly connected in investigations about pyrotechnic shock, for example finite element method (FEM) and statistical energy analysis (SEA) require inputs such as damping or coupling loss factors. These factors are empirical and must be obtained by measurements of shock.

Measuring and Analysis of Pyrotechnic Shock

A Shock Response Spectrum (SRS) is a graphical representation of a shock, or any other transient acceleration input, in terms of how a Single Degree Of Freedom (SDOF) system (like a mass on a spring) would respond to that input. The horizontal axis

shows the natural frequency of a hypothetical SDOF, and the vertical axis shows the peak acceleration which this SDOF would undergo as a consequence of the shock input.

Shock response spectrum - Wikipedia

The dynamic design analysis method is a US Navy-developed analytical procedure for evaluating the design of equipment subject to dynamic loading caused by underwater explosions. The analysis uses a form of shock spectrum analysis that estimates the dynamic response of a component to shock loading caused by the sudden movement of a naval vessel. The analytical process

simulates the interaction between the shock-loaded component and its fixed structure, and it is a standard naval engineering proce

Shock analysis – which calculates a structure’s response to time-varying loads such as the high-speed impact of a hard landing by an airplane. Drop tests – which can simulate the impact on devices or products across a wide range of variables such as if they are dropped at different heights, angles or onto different flooring materials.
