Lung organoids are useful three-dimensional (3D) cell culture models for studying human lung development and respiratory diseases including viral infections (SARS-CoV, H1N1, MERS), cystic fibrosis, asthma/COPD, exposure to air pollution and the effects of smoking. Unlike traditional immortalized pulmonary cell lines and primary cells, lung organoids contain various differentiated cell types with complex tissue architecture that more closely resemble in vivo tissues and functionality.

Lung Cancer. The lung is a breathing organ inside the chest. This organ brings oxygen into the body while breathing in and expels carbon dioxide out of the body while breathing out. There are two lungs in humans namely right lung and left lung. The left lung is bigger compared to the right lung. Lung Cancer is a malignant tumor developed in the lung which is caused due to uncontrollable growth of cells within the lung tissues. There are two stages of lung tumor.
