The anomaly detection model using one-class support vector machine (OCSVM) is able to detect malicious control instructions by analyzing the key field in EtherNet/IP packets. The experimental results show that the hierarchical IDS has an outstanding performance in detecting infiltration attacks and forging attack compared with other two innovative IDSs.

Purely based on a hierarchy of self-organizing feature maps (SOMs), an approach to network intrusion detection is investigated. Our principle interest is to establish just how far such an approach can be taken in practice. To do so, the KDD benchmark data set from the International Knowledge Discovery and Data Mining Tools Competition is employed.

A Hierarchical Detection and Response System to Enhance Security Against Lethal Cyber-Attacks in UAV Networks Abstract: Unmanned aerial vehicles (UAVs) networks have not yet received considerable research attention. Specifically, security issues are a major concern because such networks, which carry vital information, are prone to various attacks.

A Hierarchical Detection and Response System to Enhance ...

... This can be done by sending large amounts of network traffic, exploiting well-known faults in networking services, and by overloading network hosts. Intrusion Detection attempts to detect computer attacks by examining various data records observed in processes on the network and it is split into two groups, anomaly detection systems and misuse detection systems. Anomaly

After a five-level RBF-based hierarchical intrusion detection system was generated adaptively during the training stage, the SHIDS was tested using the testing data, which included NORMAL, IPSWEEP, SMURF, GUESS_PASSWORD, and BUFFER_OVERFLOW data. The results are presented in Table 3. It shows that the SHIDS has both a high detection rate, low false positive rate, and can automatically detect and classify novel intrusions.

Reducing The Data Features For Intrusion Detection Systems Using Gmm The current intrusion detections aiming at the web server attack all adopt the rule-based method, like the famous intrusion detecting system Snort2.0, which detection rules are written after the features are refined from every intrusion behavior.

The existing techniques applied the single hierarchical system to enhance intrusion detection based on anomalies. In order to enhance detection precisely under a controlled framework, Peddabachigari et al. [30] employed the support vector machines (SVMs), decision trees (DT), and a fusion classifier of DT-SVM. The group of three incorporated into a hierarchy of classifier.

Hierarchical Task Analysis of Intrusion Detection Systems

Otrok et al. have proposed a hierarchical approach [6] that attempts to balance the consumption of resources (which results from intrusion detection tasks) among the nodes of a cluster. It encourages network nodes to participate in the election of CHs and tries to prevent elected CHs from misbehaving. One of the main operational
