The process of passing the data through the neural network is known as forward propagation and the forward propagation carried out in a perceptron is explained in the following three steps. Step 1: For each input, multiply the input value x_i with weights w_i and sum all the multiplied values. Weights — represent

the strength of the connection between neurons and decides how much influence the given input will have on the neuron's output.

Neural network - Wikipedia

These neural networks try to mimic the human brain and its learning process. Like a brain takes the input, processes it and generates some output, so does the neural network. These three actions – receiving input, processing information, generating output – are represented in the form of layers in a neural network – input, hidden and output.
