### Relative Feed Value Rfv Vs

RFV = (63.97 x 3) / 1.29 = 149 Relative Feed Value reflects both digestibility (from % ADF) and intake potential (from % NDF) of alfalfa. Limitations of the RFV method include: 1. DDM and DMI are assumed constants for all forages. 2. ADF and NDF are the only laboratory values used in the calculation. 3. Crude protein concentration of forage is not used. 4.

### Understanding Relative Feed Value (RFV) and Relative ...

RFV is intended to reflect how well an animal will eat and digest a particular forage if it is fed as the only source of energy. Relative Feed Value is calculated from ADF and NDF content of a forage. Dry matter intake (DMI) as a percentage of animal body weight is predicted based on the analyzed NDF content of the forage.

### **Relative Feed Value (RFV) vs. Relative Forage Quality (RFQ)**

RFV calculates energy from ADF while RFQ is calculated by two different equations depending on whether the forage is primarily legume or grass. For grass, the equation is based on actual animal feeding data from trials conducted in the Southeast during the 1980's.

### **Comparison of Relative Forage Quality (RFQ) to Relative**

...

RFV is used to evaluate legume hay. RFV is often used as a benchmark of quality when buying or selling alfalfa hay. RFV is not used for ration formulation. Relative Forage Quality (RFQ): Like RFV, RFQ combines predicted intake (NDF) and digestibility (ADF). However, RFQ differs from RFV because it is based on estimates of forage intake and digestibility determined by incubating the feedstuff with rumen microorganisms in a simulated digestion.

### **Understanding Feed Analysis | UNL Beef**

$RFV = (63.97 \times 3) / 1.29 = 149$  Relative Feed Value reflects both digestibility (from % ADF) and intake potential (from % NDF) of alfalfa. Limitations of the RFV method include: 1. DDM and DMI are assumed constants for all forages. 2. ADF and NDF are the only laboratory values used in the calculation. 3.

### **RFV VS RFQ WHICH IS BETTER - University of Kentucky**

The most widely accepted measure of the quality of alfalfa is Relative Feed Value (RFV). RFV is an index used to compare the

quality of forages relative to the feed value of full bloom alfalfa. RFV is used to compare similar forages for two important qualities—how well it will be consumed and how well it will be digested.

### **Relative Feed Value - K-State ASI**

Relative feed value was initially developed for the dairy industry. It was designed to help rank the potential energy intake of different hays by lactating dairy cows. RFV does this quite well, especially for legumes like alfalfa. Grass hay, though, is a bit more difficult.

### **Interpreting RFV of Grass Hay - Beef Cattle**

Relative feed value is calculated from digestible dry matter and dry matter intake.  $RFV = DDM \times DMI / 1.29$  DDM = Digestible Dry Matter =  $88.9 - (.779 \times \%ADF)$  DMI = Dry Matter Intake =  $120 / \%NDF$

### **RFV Calculator - West Coast Hay Management**

One estimate of quality is relative feed value (RFV). RFV was developed for cattle and takes into account the expected digestibility of the hay as well as the expected level of consumption....

### **Relative Feed Value of Hay - The Horse**

Farmers and ranchers often tell University of Nebraska agronomist Bruce Anderson that their prairie hay, cane hay or other grass hay looks great but lab tests indicate a surprisingly low relative feed value (RFV). That's despite good protein

and satisfactory total digestible nutrient (TDN) levels. So what's wrong with RFV?

### **Relative Feed Value (RFV)--Beef Cattle Diets | Beef Magazine**

"If you still think relative feed value (RFV) is a good measure of forage quality, I'm not going to be able to help you today." That was the opening disclaimer offered by Duarte Diaz, extension dairy specialist with the University of Arizona, to the annual meeting of the Northeast Chapter of the American Registry of Professional Animal Scientists (ARPAS) held in Harrisburg, Pa., last week.

### **Count him out on RFV | Hay and Forage Magazine**

RFV is expressed as a percentage compared to full bloom Lucerne at 100% RFV. RFV's above 130 are considered good dairy quality hay. The higher the value the better with a target around 150 being considered desirable. Relative feed value is calculated using digestible dry matter and dry matter intake calculations.

### **Relative Feed Values: The nutritional value of fodder ...**

Relative Forage Quality (RFQ) vs. Relative Feed Value (RFV) Have you ever had two lots of alfalfa with the same relative feed value (RFV), one lot the cows milked great, ate it like candy and the other lot, the production dropped and the cows just didn't seem to like the forage.

### **Relative Forage Quality (RFQ) vs. Relative Feed Value**

### **(RFV)**

One estimate of quality is relative feed value (RFV). RFV was developed for cattle and takes into account the expected digestibility of the hay as well as the expected level of consumption. Basically, the assumption is the better the hay quality, the more easily the animal will digest it and the more it can consume.

### **Relative Feed Value of Hay | Equine Programs**

The Relative Feed Value (RFV) was developed by the Hay Marketing Task Force of the American Forage and Grassland Council (Rohweder et al. 1978 14). As early as 1982 (Turnbull et. al. 15) it was noted that RFV was a better gauge of alfalfa hay instead of quality grade when animal performance was examined.

### **Welcome to Foragelab**

Today there is a new technology emerging in the arena of relative feed value (RFV) testing for alfalfa hay. Because it provides the RFV for every bale produced, this method of testing will allow the dairyman or beef producer to know precisely what

each bale is bringing to the ration (although RFV itself is not directly used to calculate rations ...
