Nonlinear Analysis Of Shell Structures

This text develops, in a systematic manner, the overall concepts of the nonlinear analysis of shell structures. The authors start with a survey of theories for the analysis of plates and shells with small deflections and then lead to the theory of shells undergoing large deflections and rotations applicable to elastic laminated anisotropic materials.

This paper presents a state of the art review on geometrically nonlinear analysis of shell structures that is limited to the co-rotational approach and to flat triangular shell finite elements. These shell elements are built up from flat triangular membranes and plates.

The analyses of shell structures also have been constantly drawn much attention by engineers and researchers for many decades. In the past the main concerns in shell structures are the buckling or geometrically nonlinear behaviors, being crucial to stability and failure , . With the demands on enhancing performance of these industrial products or civil buildings, modern structure engineers are prone to encounter the so-called highly nonlinear problems.

Some important engineering phenomena can only be assessed on the basis of a nonlinear analysis: • Collapse or buckling of structures due to sudden overloads • Progressive damage behavior due to long lasting severe loads • For certain structures (e.g. cables), nonlinear phenomena need be included in the analysis even for service load calculations.

Introduction to Nonlinear Analysis - MIT OpenCourseWare

To investigate the nonlinear vibration behavior of bolted joined cylindrical-cylindrical shell, a macroslip model was considered into the radial connection at the interface between the shell segments. Based on Sanders' shell theory and the connection condition, the vibration differential equation of the structure was established.

In the first example, nonlinear transient response of two super-elliptic composite shells under the uniformly distributed load ($q=-10$ kPa for CCCC boundary condition and $q=-1$ kPa for CFCF boundary condition) is analyzed. Super-elliptic shell dimensions are: $a=1\text{m}$, $b=0.5$ m ($a/b=2$). Ovality values are taken as $n=4$ and $n=8$.

Geometrically nonlinear transient analysis of laminated ...

Nonlinear vibration analysis of sandwich shell structures with a constrained electrorheological (ER) fluid is investigated for different boundary conditions. To accomplish this, a nonlinear finite element model of a multi-layer shell structure with an ER fluid layer in the core of the sandwich shell has been developed.

Nonlinear free vibration analysis of sandwich shell ...

Small imperfections do not matter in linear analysis, however in nonlinear problems, they are quite important. Hence, instabilities of shell structures that are sensitive to geometrical and loading imperfections must be considered. The shape changes occurring due to nonlinear buckling will be examined in the following examples.

In the structural part of this work, a new methodology for the analysis of geometrically nonlinear orthotropic membrane and rotation-free shell elements is developed based on the principal fiber orientation of the material.

The use of tensor-based finite element formulations together with high-order elements for the analysis of shell structures leads to an efficient computational approach which is straightforward to implement. Such model can be applied to linear and nonlinear analyses of shells made of isotropic, laminated composite and functionally graded materials.
