linearized frequency domain solver, where the modes are coupled and require simultaneous solution of both the time-averaged and unsteady terms. Although some of the nonlinearities are addressed in the time-averaged solution, the higher order terms are still neglected in the solution of the unsteady modes. In addition, the

Abstract. The widespread acceptance of frequency domain techniques for linear and time invariant systems has been an impetus for the extension of these methodologies toward nonlinear systems. However, differences and equivalences between alternative methods have been less addressed. This paper provides a comparative overview of four classes of frequency domain methods for nonlinear systems: Volterra

based models, nonlinear frequency response functions / Bode plots, describing functions and ...

folded configuration. To this end, a nonlinear subspace identification technique formulated in the frequency domain, referred to as the FNSI method, is exploited. The frequency response functions of the underlying linear structure and the nonlinear coefficients are estimated by this approach. Nonlinearity is caused by impacts between adjacent

Harmonic balance is a method used to calculate the steady-state response of nonlinear differential equations, and is mostly applied to nonlinear electrical circuits. It is a frequency domain method for calculating the steady state, as opposed to the various time-domain steady state methods. The name "harmonic balance" is descriptive of the method, which starts with Kirchhoff's Current Law written in the frequency domain and a chosen number of harmonics.

Non-Linear HRV. Time and frequency domain measures of HRV quantify HRV on various time scales. Nonlinear HRV quantifies the structure or complexity of the heart rate pattern. For example, a random series of heart beats, a series of heart beats from a normal person and a totally periodic series of heart beats that goes up and down like a wave the exact same standard deviation (SDNN, a time domain measure of HRV), but their underlying organization would be clearly be completely different.

Identification and Analysis of Nonlinear Systems

For nonlinear systems, frequency-domain analysis methods from time-domain models include the generalised frequency response functions (GFRFs)

and the nonlinear output frequency response functions (NOFRFs), which both aid in analysing phenomena such as sub- and super-harmonics as well as resonances and energy transfer between frequencies,.
