wireless mesh network security an overview

Wireless mesh is a new network architecture that makes use of 'AoVnV=intelligent' wireless transmitters, thus providing reliability and flexibility for high-end surveillance applications. In a wireless mesh network, every mesh unit not only transmits data packets received from the cameras directly attached to it, but it can also forward packets arriving from other mesh units, via an optimal path.

In MR-LQSR, a metric called weighted cumulative expected transmission time (WCETT) is used for measuring the system performance. In WCETT, link quality and minimum number of hop counts are considered as a system metric which results in better throughput and less delay.

An Overview of Wireless Mesh Networks | IntechOpen

The multihop nature of WMN packet data transmission to the gateways has important commercial potential; nevertheless, it contributes to some of its mesh security weakness. In wireless mesh communication the security attacks are mostly interception of links and packets, denial of service attacks (DoS) (Raymond and Midkiff, 2008, Xing and Wang, 2006). The denial of Service (DoS) is a major security attack that frequently occurs in the WMN.
