Chapter X Active Infrared Thermography Techniques

Active thermography is the induction of a heat flow by energetically exciting a test object. The heat flow is influenced by interior material layers and defects. These inhomogeneities can be captured on the surface by high-precision infrared cameras.

Infrared cameras for active thermography | InfraTec

This chapter deals with the use of infrared thermography to monitor the behaviour of a material under load events. Two types of loads are considered: bending and impact. During each event, thermoelastic and/or thermoplastic effects are visualized with the infrared camera through

acquisition of thermal images in time sequence.

InfraTec’s high-end thermographiccameras are the centrepiece of active thermography solutions. Highest geometric resolutions of up to (1,920 × 1,536) IR pixels and thermal resolutions up to 0.015 K are the basis for a precise detection of smallest material defects. Because of its high image acquisition rate, active thermography can easily be used for measurements of high-heat conductive materials, such as metal.

Chapter X Active Infrared Thermography Techniques

Active thermography is an advanced nondestructive testing procedure, which uses a thermography measurement of a tested material thermal response after its external excitation. This principle can be used also for non-contact infrared non-destructive testing of materials. The IRNDT method is based on an excitation of a tested material by an external source, which brings some energy to the material. Halogen lamps, flash-lamps, ultrasonic horn or other sources can be used as the excitation source for
