No. MATLAB does not care that it is explicitly a tridiagonal matrix. However, because it IS a tridiagonal sparse matrix, AND because the sparse solver is efficient on sparse matrices, MATLAB effectively does use an extremely efficient scheme to solve the problem. Can you do better?

What is a good way to create a tridiagonal matrix in matlab?

In numerical linear algebra, the tridiagonal matrix algorithm, also known as the Thomas algorithm (named after Llewellyn Thomas), is a simplified form of Gaussian elimination that can be used to solve tridiagonal systems of equations. A tridiagonal system for n unknowns may be written as.
$$a_{i}x_{i-1}+b_{i}x_{i}+c_{i}x_{i+1}=d_{i},\forall i$$

Starting with one of the tridiagonal solver codes, make a new copy called X = tridiag inverse(A) or X = tridiag sparse inverse(a,b,c). Instead of inputting a right hand side vector f, set up a dense n n matrix F, which is initialized to the identity matrix. Now solve for a dense n n matrix X, which will be the inverse of the tridiagonal matrix.

Solving a tridiagonal linear system

Properties. A tridiagonal matrix is a matrix that is both upper and lower Hessenberg matrix. In particular, a tridiagonal matrix is a direct sum of p 1-by-1 and q 2-by-2 matrices such that p + q/2 = n — the dimension of the tridiagonal. Although a general tridiagonal matrix is not necessarily symmetric or Hermitian, many of those that arise when solving linear algebra problems have one of ...

Tridiagonal matrix equation solver (thomas algorithm) in ...

For variable-size inputs that are not variable-length vectors (1-by-: or :-by-1), diag treats the input as a matrix from which to extract a diagonal vector. This behavior occurs even if the input array is a vector at run time. To force diag to build a matrix from variable-size inputs that are not 1-by-: or :-by-1, use:

So, in the following program, the matrix is made tridiagonal by taking coefficients of the upper and lower triangles to the right side of the equation and then the algorithm is implemented. The initial guesses for the solutions are assumed which is corrected iteratively in the program.
