FIR Filter Design. Lowpass Filter Specifications. The ideal lowpass filter is one that leaves unchanged all frequency components of a signal below a designated cutoff frequency, ω_c , and rejects all components above ω_c .Because the impulse response required to implement the ideal lowpass filter is infinitely long, it is impossible to design an ideal FIR lowpass filter.

Filter design. An FIR filter is designed by finding the coefficients and filter order that meet certain specifications, which can be in the time domain (e.g. a matched filter) and/or the frequency domain (most common). Matched filters perform a cross-correlation between the input signal and a known pulse shape.

Finite impulse response - Wikipedia

Less numerically stable than their FIR (finite impulse response) counterparts, due to the feedback paths. Definition. An IIR filter is categorised by its theoretically infinite impulse response, $\displaystyle y(n)=\sum_{k=0}^{\infty}h(k)x(n-k)$ \) Practically speaking, it is not possible to compute the output of an IIR using this equation.
