Previous work for dry granular materials, such as , , , has demonstrated that a hierarchical discrete-continuum coupling model can be established by using grain-scale simulations to provide Gauss point stress update for finite element simulations in a fully implicit scheme. Nevertheless, the extension of this idea for partially or fully saturated porous media has not been explored, to the best knowledge of the authors.

A natural method for capturing localised size effect behaviour in large polycrystal boundary value problems is concurrent coupling of discrete dislocation plasticity (DDP) to the crystal plasticity finite element (CPFE) method, a continuum method that accounts for the crystal structure and homogenises the effect of crystallographic slip. A planar method for concurrent coupling of DDP to CPFE in a single crystal was developed in [8, 9].

This paper introduces a three-dimensional discrete element-finite difference coupling method, in which the discrete-continuum interactions are modeled in local coordinate systems where the force and displacement compatibilities between the coupled subdomains are considered. The method is validated using a model dynamic compaction test on sand.
