Nmap Reference Guide

Nmap (" Network Mapper ") is an open source tool for network exploration and security auditing. It was designed to rapidly scan large networks, although it works fine against single hosts. Nmap uses raw IP packets in novel ways to determine what hosts are available on the network, what services (application name and version) those hosts are offering, what operating systems (and OS versions ...

Reference guide ...

To get started. This is a simple command for scanning your local network (class C or /24): `nmap -sV -p 1-65535 192.168.1.1/24`. This command will scan all of your local IP range (assuming your in the 192.168.1.0-254 range), and will perform service identification -sV and will scan all ports -p 1-65535.

Nmap Tutorial: from the Basics to Advanced Tips

On average Nmap sends 5-10 fewer packets per host, depending on network conditions. If a single subnet is being scanned (i.e. 192.168.0.0/24) Nmap may only have to send

two packets to most hosts. -n (no DNS resolution) Tells Nmap to never do reverse DNS resolution on the active IP addresses it finds. Since DNS can be slow even with Nmap's built-in parallel stub resolver, this option can slash scanning times.

Databases, Systems & Networks » Nmap Reference Guide

Reading the nmap reference guide, I can see why I made this assumption: -sn (No port scan) This option tells Nmap not to do a port scan after host discovery, and only print out the available hosts that responded to the host discovery probes.
